

Typical Filtration Applications

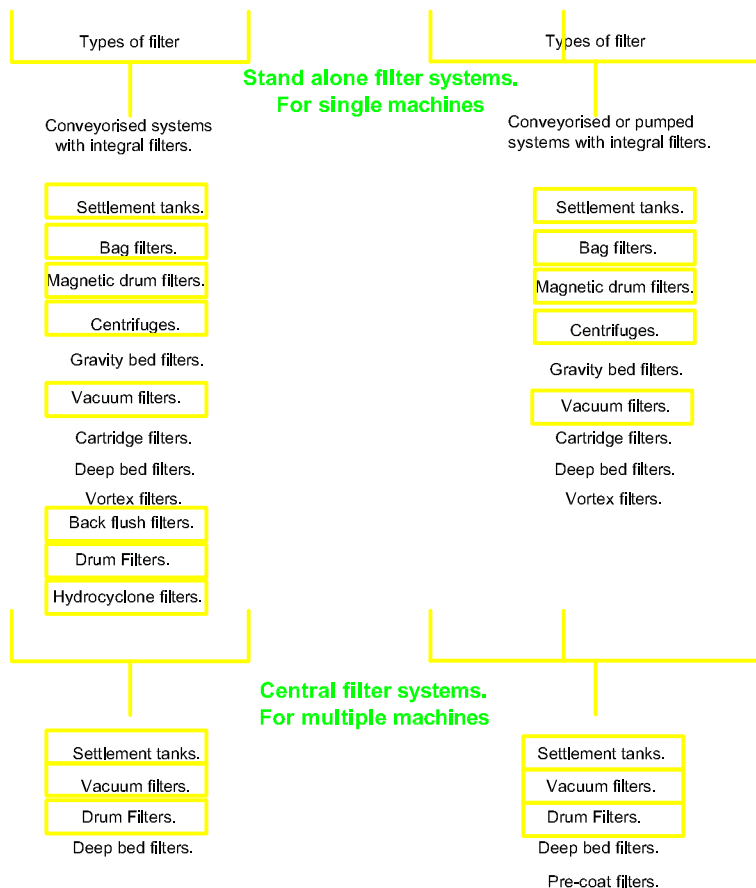

Machine operations

Coolant clarity required

Note. These figures are very general. Many machines have some special requirements which fall outside the above values. Care should be taken not to design a system without understanding all the requirements.

Integral filters.

Note. The Types of filter suggested are a guide only. Variations or adaptations and use of more than one type on any application are sometimes advisable. Many machines have some special requirements, which must be studied to arrive at the optimum solution. Care should be taken not to design a system without understanding all the requirements.

Media free filters

All filters shown with a yellow rectangle above are media free or can be offered media free.

Oil Separators

Settlement Weir type. Coalescing type. Skimmers. Centrifuge

Oil separators are required to remove tramp oils, such as hydraulic and way/lubricant oils, which enter the system, and can damage the quality and reduce the life of water based coolants.

Londonese are available to discuss, recommend and design any system to suit your requirements

Modernisation of existing equipment

Retro-fits and modification to existing filtration systems

Londonese are available to offer a design and manufacturing service complete with installation and commissioning, for system upgrades to improve clarity and efficiency of existing equipment.
